Paper 4 A Level Structured Questions

9702/42

May/June 2019

2 hours

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

This document consists of **27** printed pages and **1** blank page.

Data

speed of light in free space	$c = 3.00 \times 10^8 \text{ m s}^{-1}$
permeability of free space	$\mu_0 = 4\pi \times 10^{-7} \text{ H m}^{-1}$
permittivity of free space	$\epsilon_0 = 8.85 \times 10^{-12} \text{ F m}^{-1}$
	$(\frac{1}{4\pi\epsilon_0} = 8.99 \times 10^9 \text{ m F}^{-1})$
elementary charge	$e = 1.60 \times 10^{-19} \text{ C}$
the Planck constant	$h = 6.63 \times 10^{-34} \text{ J s}$
unified atomic mass unit	$1 \text{ u} = 1.66 \times 10^{-27} \text{ kg}$
rest mass of electron	$m_e = 9.11 \times 10^{-31} \text{ kg}$
rest mass of proton	$m_p = 1.67 \times 10^{-27} \text{ kg}$
molar gas constant	$R = 8.31 \text{ J K}^{-1} \text{ mol}^{-1}$
the Avogadro constant	$N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$
the Boltzmann constant	$k = 1.38 \times 10^{-23} \text{ J K}^{-1}$
gravitational constant	$G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$
acceleration of free fall	$g = 9.81 \text{ m s}^{-2}$

Formulae

uniformly accelerated motion	$s = ut + \frac{1}{2}at^2$ $v^2 = u^2 + 2as$
work done on/by a gas	$W = p\Delta V$
gravitational potential	$\phi = -\frac{Gm}{r}$
hydrostatic pressure	$p = \rho gh$
pressure of an ideal gas	$p = \frac{1}{3} \frac{Nm}{V} \langle c^2 \rangle$
simple harmonic motion	$a = -\omega^2 x$
velocity of particle in s.h.m.	$v = v_0 \cos \omega t$ $v = \pm \omega \sqrt{(x_0^2 - x^2)}$
Doppler effect	$f_o = \frac{f_s v}{v \pm v_s}$
electric potential	$V = \frac{Q}{4\pi\epsilon_0 r}$
capacitors in series	$1/C = 1/C_1 + 1/C_2 + \dots$
capacitors in parallel	$C = C_1 + C_2 + \dots$
energy of charged capacitor	$W = \frac{1}{2}QV$
electric current	$I = Anvq$
resistors in series	$R = R_1 + R_2 + \dots$
resistors in parallel	$1/R = 1/R_1 + 1/R_2 + \dots$
Hall voltage	$V_H = \frac{BI}{ntq}$
alternating current/voltage	$x = x_0 \sin \omega t$
radioactive decay	$x = x_0 \exp(-\lambda t)$
decay constant	$\lambda = \frac{0.693}{t_{\frac{1}{2}}}$

Answer **all** the questions in the spaces provided.

- 1 (a) Two point masses are separated by a distance x in a vacuum.
State an expression for the force F between the two masses M and m .
State the name of any other symbol used.

$\frac{G M m}{x^2}$ *G is the gravitational constant.*

.....[1]

- (b) A small sphere S is attached to one end of a rod, as shown in Fig. 1.1.

Fig. 1.1 (not to scale)

The rod hangs from a vertical thread and is horizontal.
The distance from the centre of sphere S to the thread is 8.0 cm.

A large sphere L is placed near to sphere S, as shown in Fig. 1.2.

Fig. 1.2 (not to scale)

There is a force of attraction between spheres S and L, causing sphere S to move through a distance of 1.2 mm.

The line joining the centres of S and L is normal to the rod.

- (i) Show that the angle θ through which the rod rotates is 1.5×10^{-2} rad.

$$80 \times \theta = 1.2$$

$$\theta = \frac{1.2}{80} = 0.015 \text{ rad}$$

[1]

- (ii) The rotation of the rod causes the thread to twist.
The torque T (in Nm) required to twist the thread through an angle β (in rad) is given by

$$T = 9.3 \times 10^{-10} \times \beta.$$

Calculate the torque in the thread when sphere L is positioned as shown in Fig. 1.2.

$$T = 9.3 \times 10^{-10} \times 0.015$$

$$= 1.395 \times 10^{-11}$$

torque = 1.40×10^{-11} Nm [1]

- (c) The distance between the centres of spheres S and L is 6.0 cm.
The mass of sphere S is 7.5 g and the mass of sphere L is 1.3 kg.

- (i) By equating the torque in (b)(ii) to the moment about the thread produced by gravitational attraction between the spheres, calculate a value for the gravitational constant.

$$\frac{GMm}{x^2} = 1.4 \times 10^{-11} \times 0.12 \times 10^{-2}$$

$$G = \frac{1.68 \times 10^{-14} \times x^2}{Mm}$$

$$= \frac{1.68 \times 10^{-14} \times 0.06^2}{1.3 \times 7.5 \times 10^{-3}}$$

$$= 6.2 \times 10^{-15}$$

$T_{\text{torque}} = d \times f$
 $f = \frac{1.4 \times 10^{-11}}{0.08}$
 $=$

gravitational constant = 6.2×10^{-15} Nm²kg⁻² [3]

- (ii) Suggest why the total force between the spheres may not be equal to the force calculated using Newton's law of gravitation.

..... Because the spheres are not point charges^{most}

..... [1]

[Total: 7]

⑤

- 2 (a) The first law of thermodynamics may be expressed in the form

$$\Delta U = q + w.$$

- (i) State, for a system, what is meant by:

1. $+q$

..... Increase in thermal energy of system ✓
.....

2. $+w$.

..... work done on the system ✓
.....

[2]

- (ii) State what is represented by a negative value of ΔU .

..... decrease in internal energy of the system
.....

[1]

(b) An ideal gas, sealed in a container, undergoes the cycle of changes shown in Fig. 2.1.

Fig. 2.1

At point A, the gas has volume $2.4 \times 10^{-3} \text{ m}^3$, pressure $1.6 \times 10^5 \text{ Pa}$ and temperature 300 K.

The gas is compressed suddenly so that no thermal energy enters or leaves the gas during the compression. The amount of work done is 480 J so that, at point B, the gas has volume $8.7 \times 10^{-4} \text{ m}^3$, pressure $6.6 \times 10^5 \text{ Pa}$ and temperature 450 K.

The gas is now cooled at constant volume so that, between points B and C, 1100 J of thermal energy is transferred. At point C, the gas has pressure $1.6 \times 10^5 \text{ Pa}$ and temperature 110 K.

Finally, the gas is returned to point A.

- (i) State and explain the total change in internal energy of the gas for one complete cycle ABCA.

Zero, because initial and final temp is same

[2]

- (ii) Calculate the external work done on the gas during the expansion from point C to point A.

$$\begin{aligned}
 W &= p \Delta V \\
 &= 1.6 \times 10^5 \times (2.4 \times 10^{-3} - 8.7 \times 10^{-4}) \\
 &= 244.8
 \end{aligned}$$

work done = -245 J [2]

- (iii) Complete Fig. 2.2 for the changes from:

1. point A to point B
2. point B to point C
3. point C to point A.

change	+q/J	+w/J	$\Delta U/J$
A \rightarrow B	0	+480	+480
B \rightarrow C	-1100	0	-1100
C \rightarrow A	+860	-240	+620

Fig. 2.2

$$\begin{aligned}
 480 + x - 1100 &= 0 \\
 x &= 620
 \end{aligned}$$

$$620 = x - 240$$

[4]

[Total: 11]

- 3 A spring is hung vertically from a fixed point. A mass M is hung from the other end of the spring, as illustrated in Fig. 3.1.

Fig. 3.1

The mass is displaced downwards and then released. The subsequent motion of the mass is simple harmonic.

The variation with time t of the length L of the spring is shown in Fig. 3.2.

Fig. 3.2

(a) State:

- (i) one time at which the mass is moving with maximum speed

time = 0.1 s [1]

- (ii) one time at which the spring has maximum elastic potential energy.

time = 0.4 s [1]

why

(b) Use data from Fig. 3.2 to determine, for the motion of the mass:

(i) the angular frequency ω

$$\omega = \frac{2\pi}{T} = \frac{2\pi}{0.04} = 15.70796$$

$$\omega = 15.7 \text{ rad s}^{-1} [2]$$

(ii) the maximum speed

$$\begin{aligned} v_{\text{max}} &= \omega x_0 \\ &= 15.70796 \times \frac{2.5}{100} \\ &= 0.392699 \end{aligned}$$

$$\text{maximum speed} = 0.39 \text{ m s}^{-1} [2]$$

(iii) the magnitude of the maximum acceleration.

$$\begin{aligned} a &= \omega^2 x \\ &= 15.70796^2 \times \frac{2.5}{100} \\ &= 6.1685 \end{aligned}$$

$$\text{maximum acceleration} = 6.2 \text{ m s}^{-2} [2]$$

- (c) The mass M is now suspended from two springs, each identical to that in Fig. 3.1, as shown in Fig. 3.3.

Fig. 3.3

$$\omega = \frac{2\pi}{T}$$

$$k = \frac{F}{x} \quad x = \frac{F}{k} \quad \frac{1}{1} = 1$$

$$2k = \frac{F}{x} \quad \frac{1}{2} = 0.5$$

$$k = \frac{1}{2} \frac{F}{x}$$

Suggest and explain the change, if any, in the period of oscillation of the mass. A numerical answer is not required.

amplitude will half as overall spring constant will be half, so period of oscillation will double.
double

[2]

[Total: 10]

$$a = \frac{2\pi^2}{T^2}$$

$$T = \frac{2\pi^2}{a^2}$$

7/10

- 4 (a) State what is meant by the *specific acoustic impedance* of a medium.

.....

[2]

- (b) A parallel beam of ultrasound of intensity I_0 is incident on the boundary between two media A and B, as illustrated in Fig. 4.1.

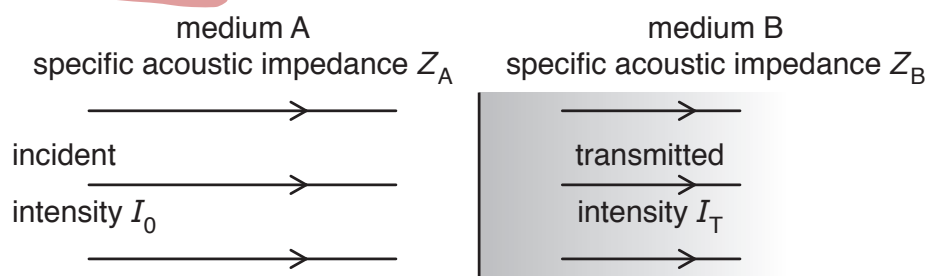

Fig. 4.1

The two media A and B have specific acoustic impedances Z_A and Z_B respectively. The intensity of the beam transmitted through the boundary is I_T .

State how the ratio

$$\frac{\text{intensity } I_T \text{ of transmitted beam}}{\text{intensity } I_0 \text{ of incident beam}}$$

depends on the relative magnitudes of Z_A and Z_B .

.....

[2]

- (c) The linear absorption (attenuation) coefficient μ of medium B is 23 m^{-1} .

Calculate the thickness of medium B required to reduce the intensity of the ultrasound beam to 34% of its initial intensity in medium B.

$$0.34 = e^{-23x}$$

$$\ln 0.34 = -23x$$

$$x = 0.0469$$

thickness = 0.0469 m [3]

4

[Total: 7]

[Turn over]

5 (a) For a signal transmitted along an optic fibre, state what is meant by:

(i) *attenuation*

loss of power

[1]

(ii) *noise.*

unwanted signal that affects the main signal.

[2]

(b) The initial section of the transmission line for a signal from a telephone exchange is illustrated in Fig. 5.1.

Fig. 5.1

At the exchange, the input signal to the transmission line has a power of $2.5 \times 10^{-3} \text{ W}$.

After the signal has travelled a distance of 52 km along the transmission line, the power of the signal is $7.8 \times 10^{-16} \text{ W}$. The signal is then amplified.

(i) Calculate the attenuation per unit length, in dB km^{-1} , in the transmission line.

$$\begin{aligned} \text{att} &= 10 \log \frac{7.8 \times 10^{-16}}{2.5 \times 10^{-3}} \\ &= -125.098 \\ &\quad \frac{125.098}{52} \end{aligned}$$

attenuation per unit length = 2.4 dB km^{-1} [3]

- (ii) The gain of the amplifier is 115 dB.

Calculate the power of the signal at the output of the amplifier.

$$10 \log \frac{V_{out}}{V_{in}} = 115$$

$$\log \frac{V_{out}}{V_{in}} = 11.5$$

$$10^{11.5} = \text{gain}$$

$$\text{gain} = 3.162 \times 10^{11}$$

$$\frac{V_{out}}{V_{in}} = 3.162 \times 10^{11}$$

$$3.162 \times 10^{11} \times 7.8 \times 10^{-6}$$

$$\text{power} = \dots\dots\dots 2.47 \times 10^{-4} \text{ W} \quad [2]$$

[Total: 8]

- 6 (a) State what is meant by *electric potential* at a point.

it is the work done per unit positive charge in bringing a small +ve charge from infinity to a point in an electric field.

[2]

- (b) Two parallel metal plates A and B are held a distance d apart in a vacuum, as illustrated in Fig. 6.1.

Fig. 6.1

Plate A is earthed and plate B is at a potential of $+V_0$.

Point P is situated in the centre region between the plates at a distance x from plate B. The potential at point P is V .

On Fig. 6.2, show the variation with x of the potential V for values of x from $x = 0$ to $x = d$.

Fig. 6.2

[3]

6

- (c) Two isolated solid metal spheres M and N, each of radius R , are situated in a vacuum. Their centres are a distance D apart, as illustrated in Fig. 6.3.

Fig. 6.3

Each sphere has charge $+Q$.

Point P lies on the line joining the centres of the two spheres, and is a distance y from the centre of sphere M.

On Fig. 6.4, show the variation with distance y of the electric potential at point P, for values of y from $y = 0$ to $y = D$.

Fig. 6.4

[4]

[Total: 9]

16

- 7 (a) Use band theory to explain why the resistance of an intrinsic semiconductor decreases as its temperature rises.

.....

.....

.....

.....

.....

.....

.....

.....

[5]

- (b) The variation with temperature t of the resistance R of a thermistor is shown in Fig. 7.1.

Fig. 7.1

The thermistor is connected into the circuit shown in Fig. 7.2.

Fig. 7.2

$$\frac{V_{out}}{V_{in}} = \frac{R}{R + R_0}$$

$$V_{out} = V_{in} \times \frac{R}{R + R_0}$$

$$\frac{V_{in} R}{R + R_0} = V_{out}$$

The battery has electromotive force (e.m.f.) 9.00 V and negligible internal resistance.

When the temperature of the thermistor is 25°C, the potential difference between the terminals A and B is 1.00 V.

The temperature of the thermistor changes from 25°C to 10°C.

Determine, to two significant figures, the change in potential difference between A and B.

final PD

$$= \frac{9 \times 2550}{2550 + 12000}$$

$$= 1.577$$

$$1.5773196 - 1 = 0.5773196$$

$$\text{change} = 0.58 \text{ V [3]}$$

- (c) The temperature of the thermistor in (b) changes from 25°C to 10°C at a constant rate.

State **two** reasons why the potential difference between A and B does **not** change at a constant rate.

1. Resistance of R does not vary linearly ✓

2. Difference between room temp and temp of R keeps increasing ✗

[2]

[Total: 10]

9

[Turn over]

- 8 An electron is travelling in a vacuum at a speed of $3.4 \times 10^7 \text{ ms}^{-1}$. The electron enters a region of uniform magnetic field of flux density 3.2 mT , as illustrated in Fig. 8.1.

Fig. 8.1

The initial direction of the electron is at an angle of 30° to the direction of the magnetic field.

- (a) When the electron enters the magnetic field, the component of its velocity v_N normal to the direction of the magnetic field causes the electron to begin to follow a circular path.

Calculate:

- (i) v_N

SOH CAH TOH

$$N = \sin 30 \times 3.4 \times 10^7 \\ = 1.7 \times 10^7$$

$$v_N = 1.7 \times 10^7 \text{ ms}^{-1} [1]$$

- (ii) the radius of this circular path.

$$Bqv = \frac{mv^2}{r}$$

$$r = \frac{mv}{Bq} = \frac{9.1 \times 10^{-31} \times 1.7 \times 10^7}{3.2 \times 10^{-3} \times 1.66 \times 10^{-19}} \\ = 2.9123 \times 10^{-2}$$

$$\text{radius} = 2.9 \times 10^{-2} \text{ m} [3]$$

- (b) State the magnitude of the force, if any, on the electron in the magnetic field due to the component of its velocity along the direction of the field.

$$0 [1]$$

- (c) Use information from (a) and (b) to describe the resultant path of the electron in the magnetic field.

Helical

—

[1]

[Total: 6]

- 9 Part of a circuit incorporating an operational amplifier (op-amp) is shown in Fig. 9.1.

Fig. 9.1

- (a) A relay is connected to the output of the op-amp circuit so that a lamp may be switched on or off.

(i) Complete Fig. 9.1 to show the relay connected into the circuit.

[2]

(ii) State and explain whether the output of the op-amp is positive or negative for the lamp to be switched on.

negative as the load is negative biased.

[2]

- (b) State the device in Fig. 9.1 that could be used so that the circuit indicates a change in:

(i) the bending of a rod

strain gauge

[1]

(ii) the level of daylight to switch on a street light.

LDR

[1]

[Total: 6]

16

- 10 (a) State Faraday's law of electromagnetic induction.

states that induced emf is proportional to rate of change of magnetic flux linkage

[2]

- (b) An ideal transformer is illustrated in Fig. 10.1.

Fig. 10.1

Explain why, when there is an alternating current in the primary coil, there is a current in the load resistor.

As the current in the primary coil creates a magnetic field which is constantly varying, so when it links with the secondary coil, it induces an emf which goes to the resistor

[3]

- (c) The primary coil in (b) has 2700 turns. The secondary coil has 450 turns.

The e.m.f. E applied across the primary coil is given by the expression

$$E = 220 \sin(100\pi t)$$

where E is measured in volts and t is the time in seconds.

Calculate the root-mean-square (r.m.s.) e.m.f. induced in the secondary coil.

$$V_{\text{rms}} = \frac{220}{\sqrt{2}} = 155.56 \text{ V} \quad \checkmark$$

$$\frac{N_p}{N_s} = \frac{E_p}{E_s}$$

$$E_s = \frac{E_p N_s}{N_p} = \frac{155.56 \times 450}{2700} = 25.926$$

r.m.s. e.m.f. = 26 V [3]

[Total: 8]

6

- 11 (a) State what is meant by a *photon*.

A quantum packet of energy of electromagnetic radiation

[2]

- (b) A stationary cobalt-60 ($^{60}_{27}\text{Co}$) nucleus emits a γ -ray photon of energy 1.18 MeV.

- (i) Calculate the wavelength of the photon.

$$E = \frac{hc}{\lambda} \quad \lambda = \frac{6.626 \times 10^{-34} \times 2.9979 \times 10^8}{1.18 \times 10^6 \times 1.6 \times 10^{-19}} = 1.052 \times 10^{-12}$$

wavelength = 1.05×10^{-12} m [2]

- (ii) Show that the momentum of the photon is 6.3×10^{-22} N s.

$$\lambda = \frac{h}{p} \quad p = \frac{h}{\lambda} = \frac{h}{1.05 \times 10^{-12}} = 6.3106 \times 10^{-22} \approx 6.3 \times 10^{-22}$$

[2]

- (c) Use information in (b)(ii) to determine the recoil speed of the cobalt-60 nucleus when the γ -ray photon is emitted.

$$1.18 \times 10^6 \times 1.6 \times 10^{-19} = \frac{1}{2} m v^2$$

$$v = 1.51 \times 10^7$$

speed = 1.51×10^7 ms⁻¹ [2]

[Total: 8]

- 12 (a) State what is meant by the *binding energy* of a nucleus.

Energy required to separate the nucleus to infinity

[2]

- (b) Some masses are shown in Fig. 12.1.

	mass/u
proton (${}^1_1\text{p}$)	1.007
neutron (${}^1_0\text{n}$)	1.009
lanthanum-141 (${}^{141}_{57}\text{La}$) nucleus	140.911

Fig. 12.1

Calculate the binding energy of a nucleus of lanthanum-141.

$$\begin{aligned}
 E &= \Delta m c^2 \\
 &= (140.911 - (57 \times 1.007 + 84 \times 1.009)) \times 1.66 \times 10^{-27} \times c^2 \\
 &= -2.065 \times 10^{-27} \text{ J} \\
 &= -1.85596 \times 10^{-10} \text{ J}
 \end{aligned}$$

binding energy = 1.86×10^{-10} J [4]

- (c) The nuclide lanthanum-141 (${}^{141}_{57}\text{La}$) has a half-life of 3.9 hours.

Initially, a radioactive source contains only lanthanum-141. The initial activity of the source is A_0 .

- (i) Calculate the time for the activity of the lanthanum-141 to be reduced to $0.40A_0$.

$$\lambda = \frac{\ln 2}{3.9 \times 60^2} = 4.9369 \times 10^{-5} \text{ s}^{-1}$$

$$\frac{0.4}{1} = e^{-4.9369 \times 10^{-5} \times t}$$

$$\ln 0.4 = -t$$

$$t = \frac{1.8563 \times 10^4}{60^2} = 5.1365 \text{ hours}$$

$$-4.9369 \times 10^{-5}$$

time = 5.2 hours [3]

- (ii) Suggest why the total activity of the radioactive source measured at the time calculated in (i) may be greater than $0.40A_0$.

that may include Bg radiation.
random nature of decay [1]

[Total: 10]
