Paper 4 A Level Structured Questions

9702/42

May/June 2018

2 hours

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

This document consists of **25** printed pages and **3** blank pages.

Data

speed of light in free space	$c = 3.00 \times 10^8 \text{ m s}^{-1}$
permeability of free space	$\mu_0 = 4\pi \times 10^{-7} \text{ H m}^{-1}$
permittivity of free space	$\epsilon_0 = 8.85 \times 10^{-12} \text{ F m}^{-1}$
	$(\frac{1}{4\pi\epsilon_0} = 8.99 \times 10^9 \text{ N C}^{-1})$
elementary charge	$e = 1.60 \times 10^{-19} \text{ C}$
the Planck constant	$h = 6.63 \times 10^{-34} \text{ J s}$
unified atomic mass unit	$1 \text{ u} = 1.66 \times 10^{-27} \text{ kg}$
rest mass of electron	$m_e = 9.11 \times 10^{-31} \text{ kg}$
rest mass of proton	$m_p = 1.67 \times 10^{-27} \text{ kg}$
molar gas constant	$R = 8.31 \text{ J K}^{-1} \text{ mol}^{-1}$
the Avogadro constant	$N_A = 6.02 \times 10^{23} \text{ mol}^{-1}$
the Boltzmann constant	$k = 1.38 \times 10^{-23} \text{ J K}^{-1}$
gravitational constant	$G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$
acceleration of free fall	$g = 9.81 \text{ m s}^{-2}$

Formulae

uniformly accelerated motion

$$s = ut + \frac{1}{2}at^2$$

$$v^2 = u^2 + 2as$$

work done on/by a gas

$$W = p\Delta V$$

gravitational potential

$$\phi = - \frac{Gm}{r}$$

hydrostatic pressure

$$p = \rho gh$$

pressure of an ideal gas

$$p = \frac{1}{3} \frac{Nm}{V} \langle c^2 \rangle$$

simple harmonic motion

$$a = -\omega^2 x$$

velocity of particle in s.h.m.

$$v = v_0 \cos \omega t$$

$$v = \pm \omega \sqrt{(x_0^2 - x^2)}$$

Doppler effect

$$f_o = \frac{f_s v}{v \pm v_s}$$

electric potential

$$V = \frac{Q}{4\pi\epsilon_0 r}$$

capacitors in series

$$1/C = 1/C_1 + 1/C_2 + \dots$$

capacitors in parallel

$$C = C_1 + C_2 + \dots$$

energy of charged capacitor

$$W = \frac{1}{2} QV$$

electric current

$$I = Anvq$$

resistors in series

$$R = R_1 + R_2 + \dots$$

resistors in parallel

$$1/R = 1/R_1 + 1/R_2 + \dots$$

Hall voltage

$$V_H = \frac{BI}{ntq}$$

alternating current/voltage

$$x = x_0 \sin \omega t$$

radioactive decay

$$x = x_0 \exp(-\lambda t)$$

decay constant

$$\lambda = \frac{0.693}{t_{\frac{1}{2}}}$$

BLANK PAGE

Answer all the questions in the spaces provided.

- 1 (a) (i) A gravitational field may be represented by lines of gravitational force.
State what is meant by a *line of gravitational force*.

An imaginary line shows a region of space where a mass experiences a force.

[1]

- (ii) By reference to lines of gravitational force near to the surface of the Earth, explain why the gravitational field strength g close to the Earth's surface is approximately constant.

Near the surface of earth, the field lines are parallel and high above surface, h , is negligible compared the radius of earth, hence gravitational field strength is almost constant.

(b)

[3]

- (b) The Moon may be considered to be a uniform sphere of diameter 3.4×10^3 km and mass 7.4×10^{22} kg. The Moon has no atmosphere.

During a collision of the Moon with a meteorite, a rock is thrown vertically up from the surface of the Moon with a speed of 2.8 km s^{-1} .

Assuming that the Moon is isolated in space, determine whether the rock will travel out into distant space or return to the Moon's surface.

$$\frac{GMm}{r} = \frac{1}{2}mv^2$$

$$\begin{aligned} r &= \frac{3.4 \times 10^6}{2} \\ &= 1.7 \times 10^6 \end{aligned}$$

$$v = \sqrt{\frac{2GM}{r}}$$

$$= \sqrt{\frac{2(6.67 \times 10^{-11})(7.4 \times 10^{22})}{1.7 \times 10^6}}$$

$$\begin{aligned} \text{Min escape } V &= 2.4097 \times 10^3 \text{ m/s} \\ &= 2.41 \text{ km/s} \end{aligned}$$

[4]

the rock will travel out into space

[Total: 8]

6

[Turn over]

Assumptions #?

6

- 2 (a) Use one of the assumptions of the kinetic theory of gases to explain why the potential energy of the molecules of an ideal gas is zero.

As the molecules have no intermolecular forces therefore, there are no forces of attraction [1]

- (b) The average translational kinetic energy E_K of a molecule of an ideal gas is given by the expression

$$E_K = \frac{1}{2}m\langle c^2 \rangle = \frac{3}{2}kT$$

= Add Derivation to Anki

where m is the mass of a molecule and k is the Boltzmann constant.

State the meaning of the symbol

- (i) $\langle c^2 \rangle$,

mean square speed of the molecules which move in many directions [1]

- (ii) T .

Thermodynamic Temp (in Kelvin) [1]

- (c) A cylinder of constant volume $4.7 \times 10^4 \text{ cm}^3$ contains an ideal gas at pressure $2.6 \times 10^5 \text{ Pa}$ and temperature 173°C .

The gas is heated. The thermal energy transferred to the gas is 2900 J. The final temperature and pressure of the gas are T and p , as illustrated in Fig. 2.1.

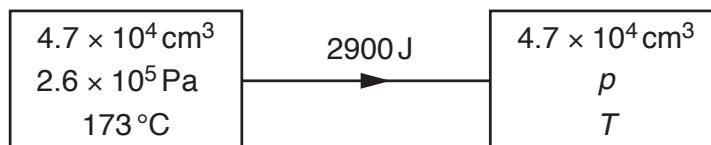

Fig. 2.1

- (i) Calculate

1. the number N of molecules in the cylinder,

$$n = \frac{PV}{RT} = \frac{2.6 \times 10^5 \times \left(\frac{4.7 \times 10^4}{100^3} \right)}{8.31 \times (173 + 273)} \\ = 3.2971 \text{ mol}$$

$$N = 3.2971 \times 6.02 \times 10^{23} = 1.9848688 \times 10^{24} \\ N = 2.0 \times 10^{24}$$

[3]

2. the increase in average kinetic energy of a molecule during the heating process.

#

$$\frac{29.00}{1.9848 \times 10^{-24}}$$

increase = $1.46 \times 10^{-2} \text{ J}$

- (ii) Use your answer in (i) part 2 to determine the final temperature T , in kelvin, of the gas in the cylinder.

Q
.

X

$$\begin{aligned}\frac{3}{2} k T &= 1.46 \times 10^{-2} \\ T &= \frac{2 \times 1.46 \times 10^{-2}}{3 \times 1.38 \times 10^{-23}} \\ &= 70.58\end{aligned}$$

$T = \dots$ K [3]

[Total: 10]

6
10

- 3 (a) During melting, a solid becomes liquid with little or no change in volume.

Use kinetic theory to explain why, during the melting process, thermal energy is required although there is no change in temperature.

The supplied energy is used to overcome the IMF and break the bonds between the molecules. The KE of the molecules remains constant hence the constant temperature. So PE of molecules increases which requires energy.

[3]

- (b) An aluminium can of mass 160g contains a mass of 330g of warm water at a temperature of 38°C, as illustrated in Fig. 3.1.

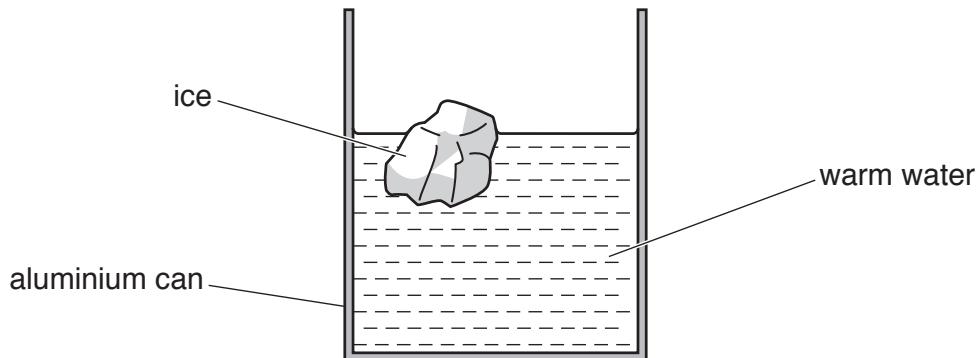

Fig. 3.1

A mass of 48g of ice at -18°C is taken from a freezer and put in to the water. The ice melts and the final temperature of the can and its contents is 23°C.

Data for the specific heat capacity c of aluminium, ice and water are given in Fig. 3.2.

	$c/\text{Jg}^{-1}\text{K}^{-1}$
aluminium	0.910
ice	2.10
water	4.18

Fig. 3.2

Assuming no exchange of thermal energy with the surroundings,

- (i) show that the loss in thermal energy of the can and the warm water is $2.3 \times 10^4 \text{ J}$,

$$\begin{aligned} q_f &= m_1 c_1 \Delta t + m_2 c_2 \Delta t \\ &= 160 \times 0.91 \times 15 + 330 \times 4.18 \times 15 \\ &= 2184 + 20691 \\ &= 2.2875 \times 10^4 \text{ J} \\ &\approx 2.3 \times 10^4 \end{aligned}$$

[2]

- (ii) use the information in (i) to calculate a value L for the specific latent heat of fusion of ice.

$$\begin{aligned} 2.2875 \times 10^4 &= (48 \times 2.1 \times 18) + 48L + (48 \times 4.18 \times 23) \\ 2.2875 \times 10^4 &= 1814.4 + 48L + 4614.72 \\ 48L &= 16445.88 \\ L &= 342.6225 \end{aligned}$$

$L = \dots \quad 340 \quad \text{J g}^{-1}$ [2]

[Total: 7]

6

- 4 (a) State two conditions necessary for a mass to be undergoing simple harmonic motion.

1. acceleration must be proportional to displacement ✓
2. acc and dis are in opposite directions. ✓ [2]

- (b) A trolley of mass 950g is held on a horizontal surface by means of two springs attached to fixed points P and Q, as shown in Fig. 4.1.

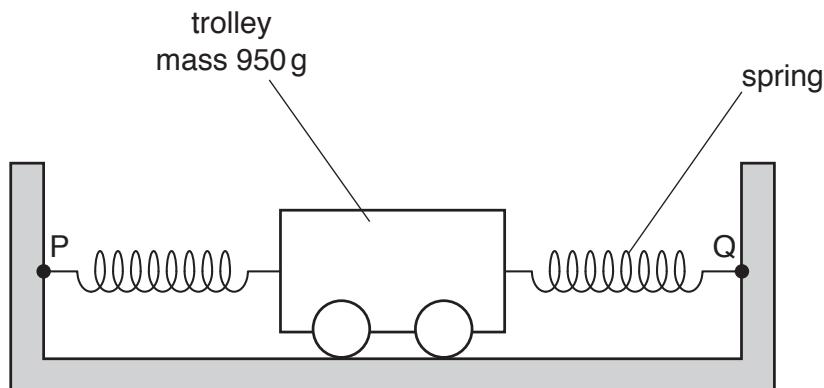

Fig. 4.1

The springs, each having a spring constant k of 230 N m^{-1} , are always extended.

The trolley is displaced along the line of the springs and then released.

The variation with time t of the displacement x of the trolley is shown in Fig. 4.2.

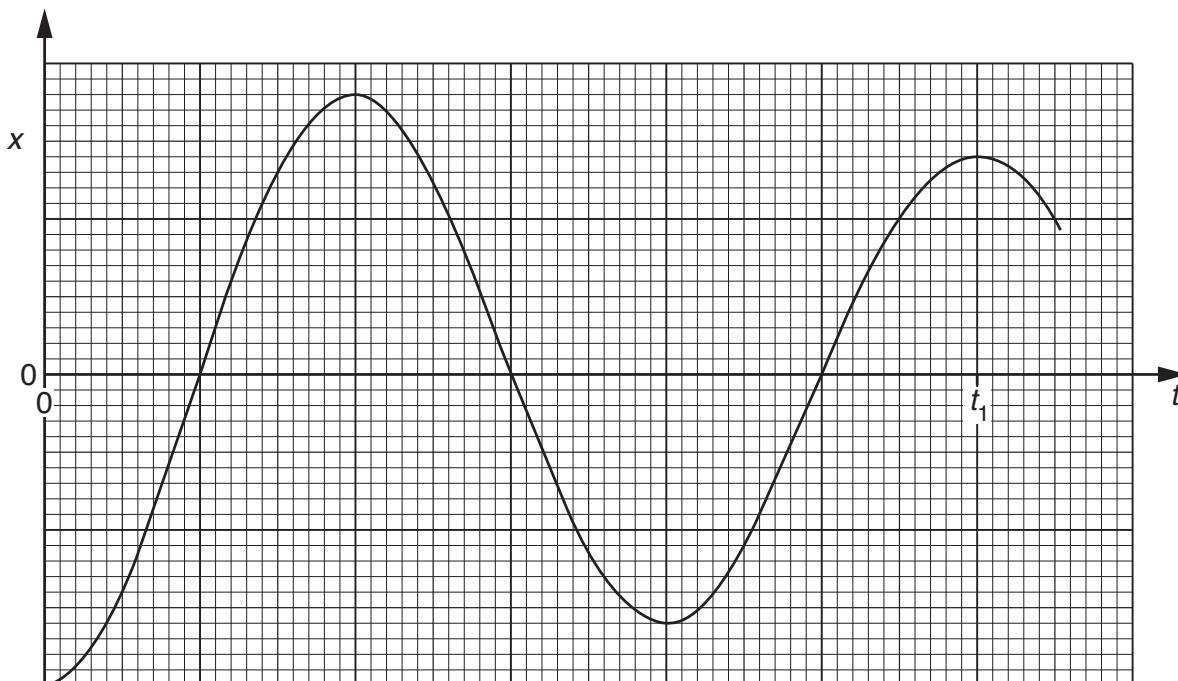

Fig. 4.2

- (i) 1. State and explain whether the oscillations of the trolley are heavily damped, critically damped or lightly damped.

Lightly, amplitude decreases gradually

2. Suggest the cause of the damping.

friction between the wheels and the surface. So loss of energy

[3] (2)

- (ii) The acceleration a of the trolley of mass m may be assumed to be given by the expression

$$a = -\left(\frac{2k}{m}\right)x.$$

$$\alpha = -\omega^2 x$$

1. Calculate the angular frequency ω of the oscillations of the trolley.

$$\begin{aligned} \omega^2 &= \frac{2k}{m} \\ \omega &= \sqrt{\frac{2k}{m}} = \sqrt{\frac{2(230)}{0.95}} \\ &= 22.00478 \end{aligned}$$

$$\omega = 22.0 \text{ rad s}^{-1} [3]$$

2. Determine the time t_1 shown on Fig. 4.2.

$$\omega = \frac{2\pi}{T}$$

$$T = \frac{2\pi}{22.00478} = 0.28555$$

$$t_1 = 0.29 \text{ s} [2]$$

[Total: 10]

- 5 (a) In radio communication, the bandwidth of an FM transmission is greater than the bandwidth of an AM transmission.

State

- (i) what is meant by *bandwidth*,

Range of frequencies

[1]

- (ii) one advantage and one disadvantage of a greater bandwidth.

#

advantage: *more info can be transmitted / Better*

audio quality

disadvantage: *less range*

[2]

- (b) A carrier wave has a frequency of 650 kHz and is measured to have an amplitude of 5.0 V.

The carrier wave is frequency modulated by a signal of frequency 10 kHz and amplitude 3.0 V. The frequency deviation of the carrier wave is $8.0 \text{ kHz} \text{ V}^{-1}$.

Determine, for the frequency modulated carrier wave,

- (i) the measured amplitude,

amplitude = *5*

v [1]

- (ii) the maximum and the minimum frequencies,

$$8 \times 3 = 24 \therefore \pm 24 \text{ not } \pm 8$$

maximum frequency = *658* kHz

minimum frequency = *642* kHz

[2]

- (iii) the minimum time between a maximum and a minimum transmitted frequency.

$$\frac{1}{1000}$$

time = 1×10^{-3} s [1] X

[Total: 7]

- 6 (a) Explain what is meant by the *capacitance* of a parallel plate capacitor.

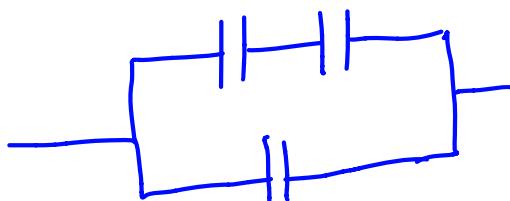

Ratio of charge to potential, where charge is the magnitude of charge on one of the plates and potential is the pd between the two plates.

[3]

- (b) Three parallel plate capacitors each have a capacitance of $6.0 \mu\text{F}$.

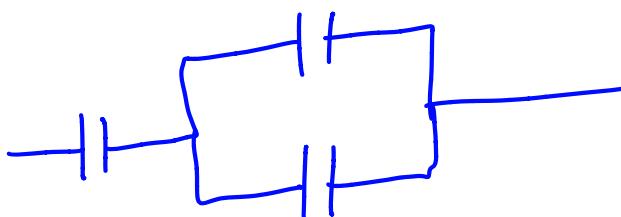

Draw circuit diagrams, one in each case, to show how the capacitors may be connected together to give a combined capacitance of

- (i) $9.0 \mu\text{F}$,

[1]

- (ii) $4.0 \mu\text{F}$.

[1]

- (c) Two capacitors of capacitances $3.0 \mu\text{F}$ and $2.0 \mu\text{F}$ are connected in series with a battery of electromotive force (e.m.f.) 8.0 V , as shown in Fig. 6.1.

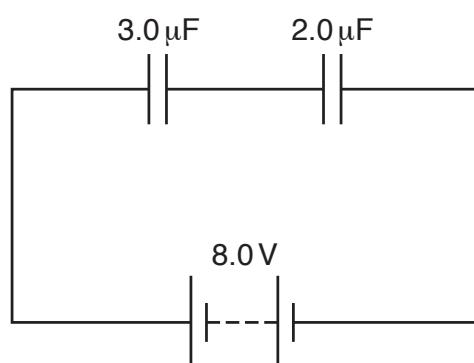

Fig. 6.1

- (i) Calculate the combined capacitance of the capacitors.

$$\left(\frac{1}{3} + \frac{1}{2}\right)^{-1}$$

capacitance = 1.2 μF [1]

- (ii) Use your answer in (i) to determine, for the capacitor of capacitance 3.0 μF ,

1. the charge on one plate of the capacitor,

#

$$q = CV \\ = 1.2 \times 8 = 9.6$$

$$V = \frac{q}{C} = \frac{9.6}{3} = 3.2 \text{ V}$$

$$q = \frac{CV}{2} = \frac{3.2 \times 3.2}{2} = 9.6$$

charge = 9.6 μC

2. the energy stored in the capacitor.

$$E = \frac{Q^2}{2C} = \frac{(9.6 \times 10^{-6})^2}{2(3 \times 10^{-6})} \\ = 1.536 \times 10^{-5}$$

energy = 1.54 $\times 10^{-5}$

[4]

[Total: 10]

10

- 7 (a) Negative feedback is often used in amplifiers.

State

- (i) what is meant by *negative feedback*,

It is the fraction of V_{out} that is sent back to the inverting input

[2]

- (ii) two effects of negative feedback on the gain of an amplifier.

1. *lower gain*

2. *greater bandwidth*

[2]

- (b) An ideal operational amplifier (op-amp) is incorporated into the circuit shown in Fig. 7.1.

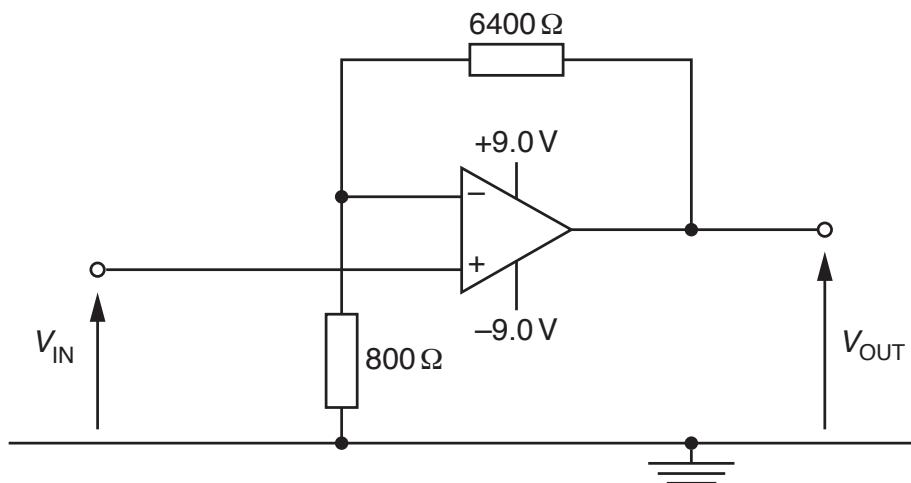

Fig. 7.1

- (i) Calculate the gain G of the amplifier circuit.

$$\frac{1 + R_F}{R_{in}} = 1 + \frac{6400}{800} \\ = 9$$

$$G = \dots \quad 9$$

[1]

- (ii) Determine the output potential difference V_{OUT} for an input potential difference V_{IN} of

1. +0.60 V,

$$\begin{aligned}V_{\text{out}} &= 9(0.6 - 0) \\&= 5.4\end{aligned}$$

$$V_{\text{OUT}} = \dots + 5.4 \dots \text{ V}$$

2. -2.1 V.

$$= 9(-2.1)$$

$$-18.9$$

$$V_{\text{OUT}} = \dots - 9 \dots \text{ V}$$

[2]

- (iii) The gain of the amplifier shown in Fig. 7.1 is constant.

State one change that may be made to the circuit of Fig. 7.1 so that the amplifier circuit monitors temperature with the gain decreasing as the temperature rises.

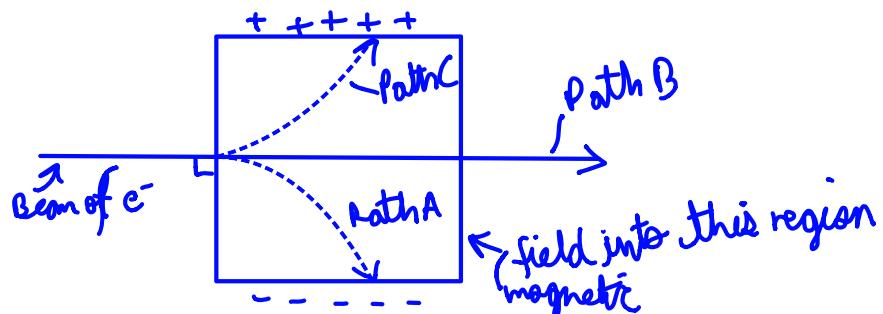

Replace 6400Ω resistor with a thermistor

[1]

[Total: 8]

8

- 8 (a) Explain how a uniform magnetic field and a uniform electric field may be used as a velocity selector for charged particles.

with velocity, v ,

A beam of electrons¹ is fired perpendicular to a region of magnetic field (into screen), electrons would follow path A, however when the electric field is turned on, and adjusted, the electrons travel undeviated through the [3] region.

- (b) Particles having mass m and charge $+1.6 \times 10^{-19} \text{ C}$ pass through a velocity selector. They then enter a region of uniform magnetic field of magnetic flux density 94 mT with speed $3.4 \times 10^4 \text{ ms}^{-1}$, as shown in Fig. 8.1.

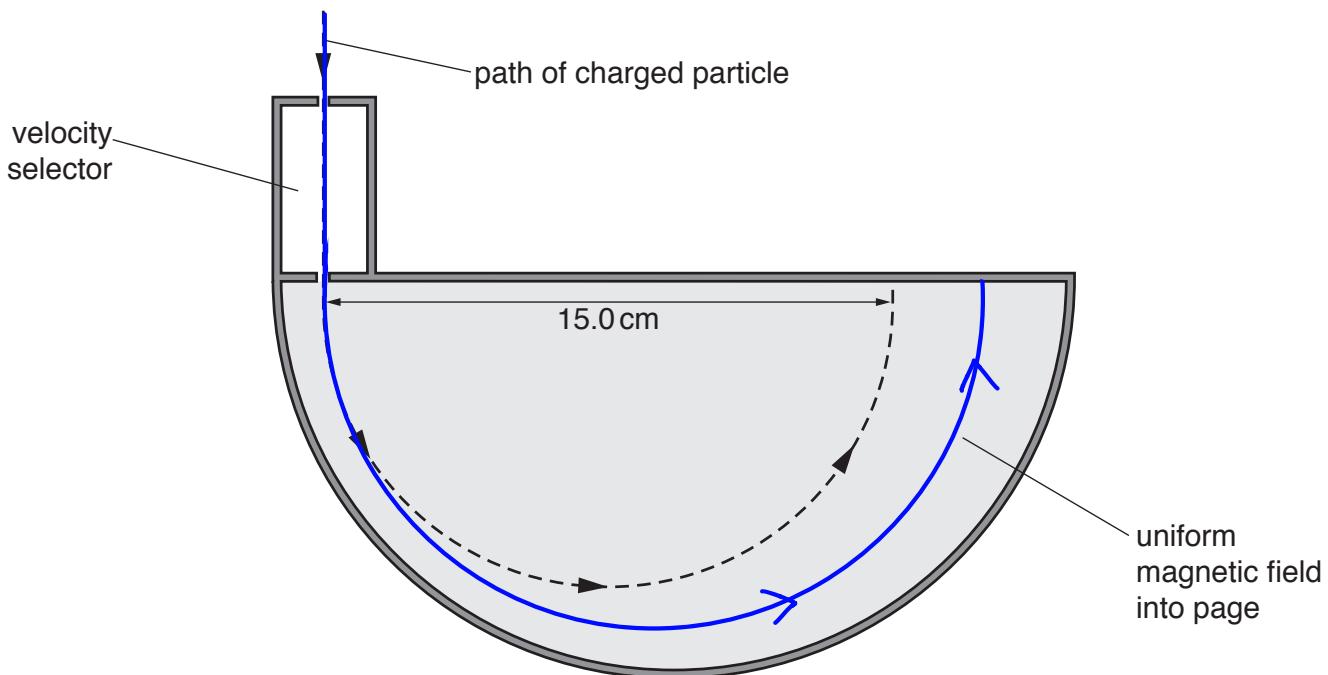

Fig. 8.1

The direction of the uniform magnetic field is into the page and normal to the direction in which the particles are moving.

The particles are moving in a vacuum in a circular arc of diameter 15.0 cm.

Show that the mass of one of the particles is 20 u.

$$Bq/r = \frac{mv}{r}$$

$$m = \frac{Bqr}{v} = \frac{94 \times 10^{-3} \times 1.6 \times 10^{-19} \times 0.075}{3.4 \times 10^4} \\ = 3.3176 \times 10^{-26} \text{ kg}$$

$$\therefore \frac{3.3176 \times 10^{-26}}{1.66 \times 10^{-27}} = 19.9858 \text{ u} \\ \approx 20 \text{ u}$$

[4]

- (c) On Fig. 8.1, sketch the path in the uniform magnetic field of a particle of mass 22 u having the same charge and speed as the particle in (b). [2]

m or r

[Total: 9]

Turn over

- 9 (a) State what is meant by the *magnetic flux linkage* of a coil.

odd

$\phi = NBA$, where ϕ is the magnetic flux linkage, N is the number of turns, B is the magnetic field strength, A is the cross sectional area of the coil. [3]

- (b) A coil of wire has 160 turns and diameter 2.4 cm. The coil is situated in a uniform magnetic field of flux density 7.5 mT, as shown in Fig. 9.1.

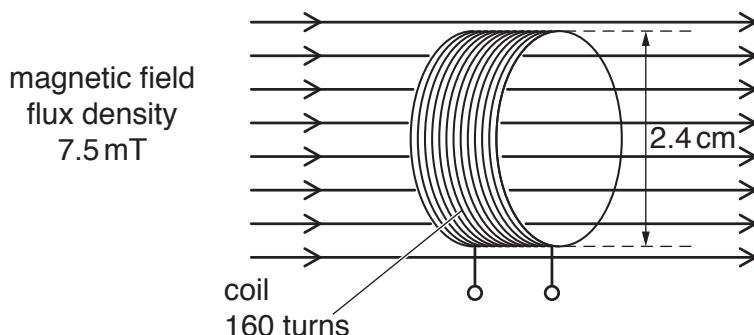

Fig. 9.1

The direction of the magnetic field is along the axis of the coil.

The magnetic flux density is reduced to zero in a time of 0.15 s.

Show that the average e.m.f. induced in the coil is 3.6 mV.

$$\text{emf} = \frac{160 \times \pi (1.2 \times 10^{-2})^2 \times 7.5 \times 10^{-3}}{0.15}$$

$$= 3.619 \times 10^{-3} V \approx 3.6 \text{ mV}$$

[2]

- (c) The magnetic flux density B in the coil in (b) is now varied with time t as shown in Fig. 9.2.

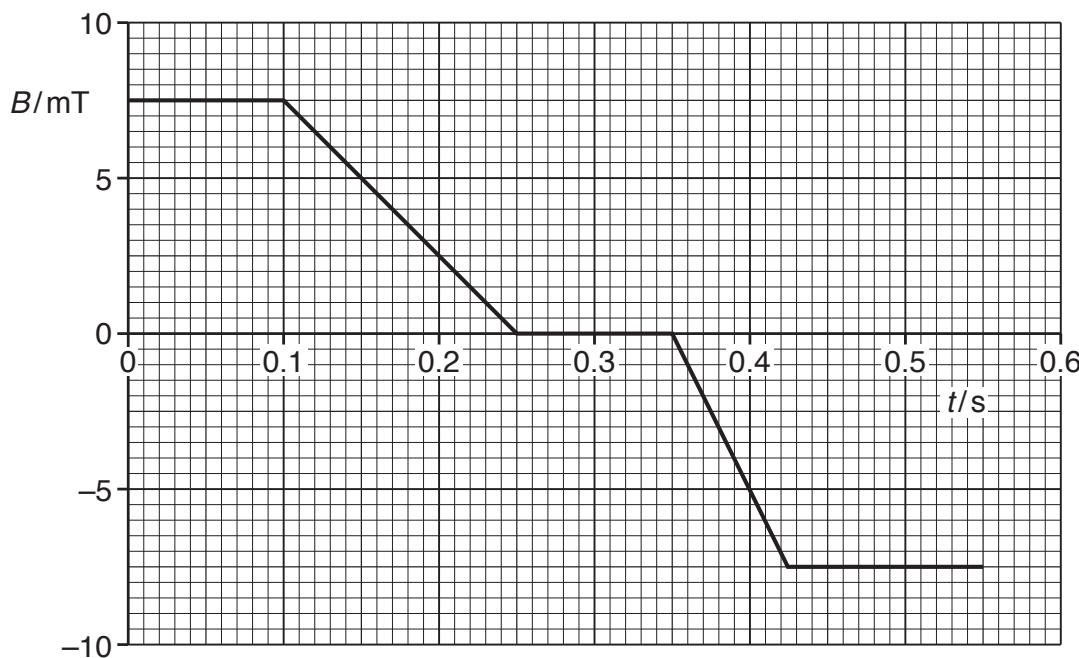

Fig. 9.2

Use data in (b) to show, on Fig. 9.3, the variation with time t of the e.m.f. E induced in the coil.

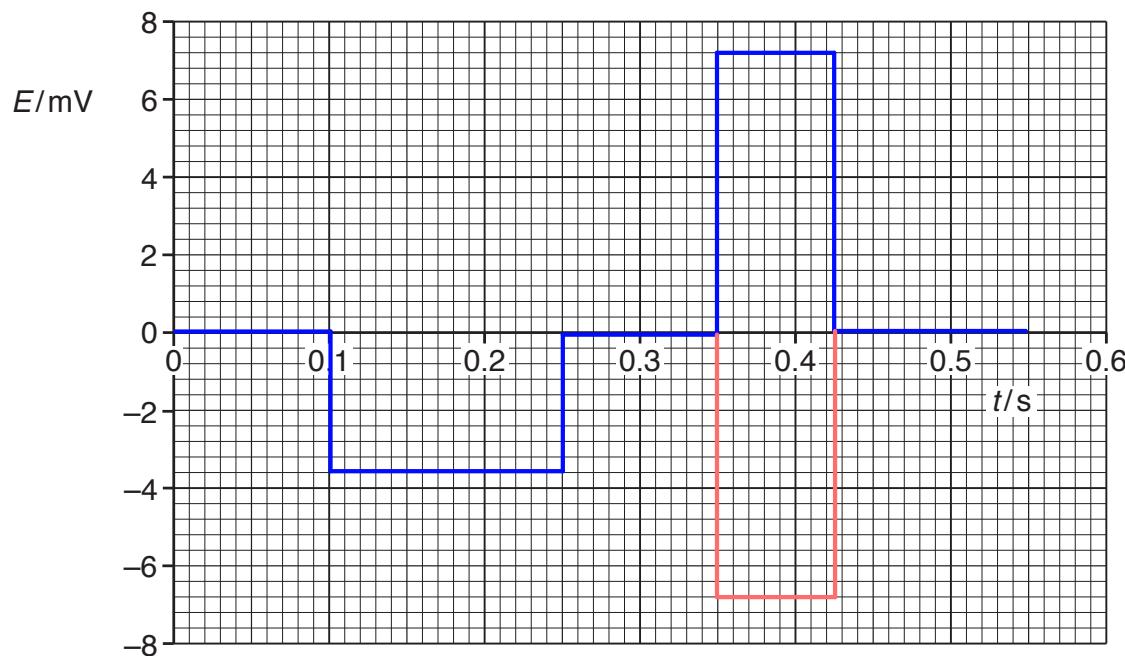

Fig. 9.3

8
[4]

[Total: 9]

8

- 10 (a) Describe the photoelectric effect.

It is the emission of electrons when a photon hits the surface of a metal.

[2]

- (b) Data for the work function energy Φ of two metals are shown in Fig. 10.1.

	Φ/J
sodium	3.8×10^{-19}
zinc	5.8×10^{-19}

Fig. 10.1

Light of wavelength 420 nm is incident on the surface of each of the metals.

- (i) State what is meant by a photon.

A quantum packet of energy of electromagnetic radiation

[2]

- (ii) Calculate the energy of a photon of the incident light.

$$E = \frac{hc}{\lambda} = \frac{(6.63 \times 10^{-34} \times 3 \times 10^8)}{420 \times 10^{-9}} = 4.7357 \times 10^{-19}$$

energy = J [2]

- (iii) State whether photoelectric emission will occur from each of the metals.

sodium: Yes

zinc: No

[1]

[Total: 7]

7

- 11 (a) Describe the basic principles of CT scanning (computed tomography).

X-Ray is used to capture image of a section, images of this slice are captured from many angles in the same plane. This is repeated for many sections throughout the body, the data is fed to a computer which creates 3D image of the body, which can be viewed from any angle.

[5]

(b) By reference to your answer in (a), suggest why

- (i) CT scanning was not possible before fast computers with large memories were available,

processing of images required many calculations
which would not be possible with a slow computer

[1]

- (ii) the radiation dose for a CT scan is much larger than for an X-ray image of a leg bone.

During a CT scan, many X-ray images are captured
however in X-ray, it's just one exposure.

[1]

[Total: 7]

6

- 12 (a) State what is meant by *radioactive decay*.

It is the spontaneous emission of radiation by unstable nuclei.

[2]

- (b) An unstable nuclide P has decay constant λ_P and decays to form a nuclide D. This nuclide D is unstable and decays with decay constant λ_D to form a stable nuclide S. The decay chain is illustrated in Fig. 12.1.

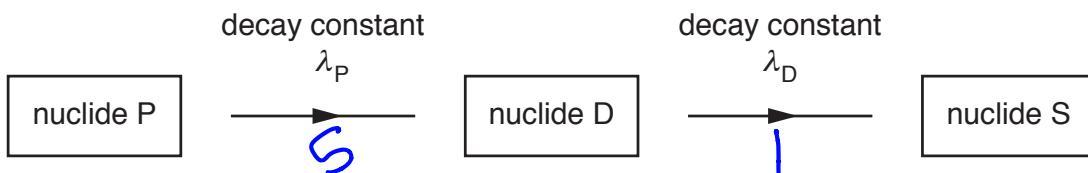

Fig. 12.1

The symbols P, D and S are not the nuclide symbols.

Initially, a radioactive sample contains only nuclide P.

The variation with time t of the number of nuclei of each of the three nuclides in the sample is shown in Fig. 12.2.

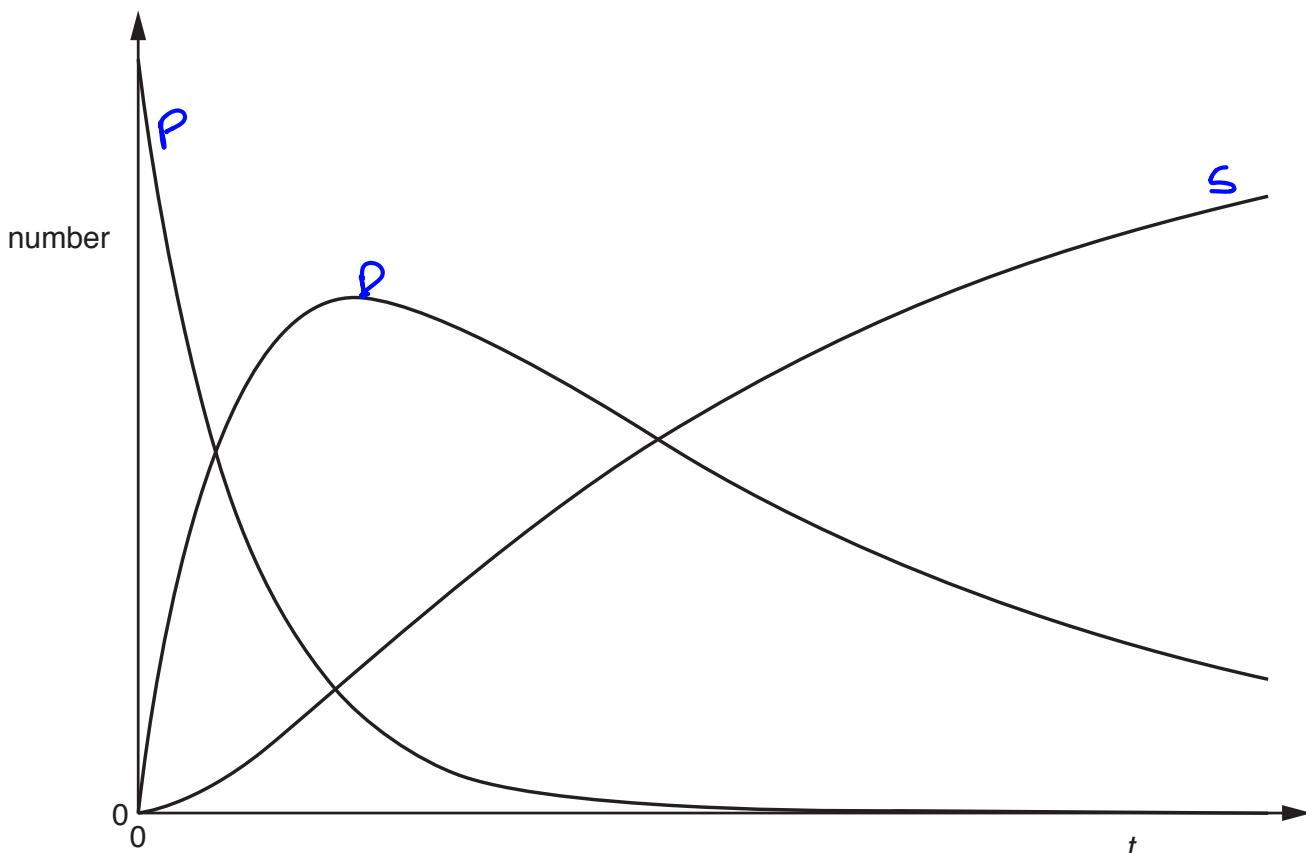

Fig. 12.2

- (i) On Fig. 12.2, use the symbols P, D and S to identify the curve for each of the three nuclides. [2]

- (ii) The half-life of nuclide P is 60.0 minutes.

Calculate the decay constant λ_P , in s^{-1} , of this nuclide.

$$\lambda = \frac{\ln 2}{60 \times 60} = 1.0254 \times 10^{-9}$$

$$\lambda_P = 1.9 \times 10^{-4} s^{-1}$$

- (c) In the decay chain shown in Fig. 12.1, λ_P is approximately equal to $5\lambda_D$.

The decay chain of a different nuclide E is illustrated in Fig. 12.3.

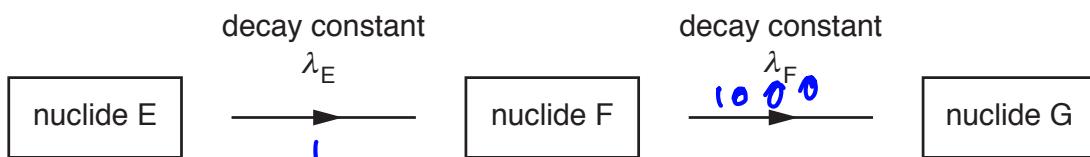

Fig. 12.3

The decay constant λ_F of nuclide F is very much larger than the decay constant λ_E of nuclide E.

By reference to the half-life of nuclide F, explain why the number of nuclei of nuclide F in the sample is always small.

*because all the halflife of F is very small
and so all the nuclei of F that is formed,
decays quickly, forming G.*
