Answer **all** the questions in the spaces provided.

- 1 (a) State Newton's law of gravitation.

*Force between two point masses is proportional to the product of their masses and inversely proportional to the square of the distance between their centers.* [2]

- (b) The astronomer Johannes Kepler showed that the period  $T$  of rotation of a planet about the Sun is related to its mean distance  $R$  from the centre of the Sun by the expression

$$\frac{R^3}{T^2} = k$$

where  $k$  is a constant.

Use Newton's law to show that, for planets in circular orbits about the Sun of mass  $M$ , the constant  $k$  is given by

$$k = \frac{GM}{4\pi^2}$$

where  $G$  is the gravitational constant. Explain your working.

$$\begin{aligned} \frac{GMm}{r^2} &= m r \omega^2 \\ GM &= r^3 \left(\frac{2\pi}{T}\right)^2 \\ GM &= r^3 \times \frac{4\pi^2}{T^2} \\ \frac{GM}{4\pi^2} &= \frac{r^3}{T^2} \end{aligned}$$

[4]

- (c) A satellite is in a circular orbit about Mars.

The radius of the orbit of the satellite is  $4.38 \times 10^6$  m. The orbital period is 2.44 hours.

Use the expressions in (b) to calculate a value for the mass of Mars.

$$M = \frac{4\pi^2 r^3}{GT^2}$$

$$= \frac{4\pi^2 (4.38 \times 10^6)^3}{G (2.44 \times 60^2)^2} = 6.45 \times 10^{23}$$

$$\text{mass} = 6.45 \times 10^{23} \text{ kg} [2]$$
